According to our latest research, the global Wireless Fire Detection market size will reach USD 2086 million in 2031, growing at a CAGR of 6.5% over the analysis period.

Wireless Fire Detection refers to fire detection systems that use wireless technology to transmit signals from smoke, heat, or flame detectors to a central control unit. Unlike traditional fire detection systems that rely on wired connections, wireless systems communicate via radio frequencies. This makes installation easier and more flexible, especially in buildings where running wires is difficult or expensive. Wireless fire detection systems can be part of a larger smart building infrastructure, offering real-time monitoring, automatic alerts, and integration with other safety or security systems.
