A wireless hanging scale is a device used to weigh heavy objects during the lifting process. It primarily senses the gravity of the objects through a load cell, converts it into an electrical signal, and then utilizes wireless communication technology to transmit the weight data to a receiving device for display and processing. The equipment typically consists of a handheld weighing display and a hook installed on the crane. This type of scale eliminates the constraints of traditional wired connections, facilitating its use in various complex lifting environments such as ports, construction sites, warehouses, and other locations.
