Abstracts

According to our (Global Info Research) latest study, the global Wireless Interface IP market size was valued at US\$ 316 million in 2025 and is forecast to a readjusted size of US\$ 546 million by 2032 with a CAGR of 8.3% during review period.

Wireless Interface IP is a key IP category that enables wireless connectivity in chips by packaging RF transceiver functions, physical-layer modulation/demodulation, baseband processing, link control, protocol stacks, secure connectivity and low-power management required by wireless standards such as Wi-Fi, Bluetooth, UWB, Zigbee, Thread and cellular IoT into reusable design assets. It helps chip companies rapidly integrate wireless connectivity into MCUs, SoCs, wearables, smart home devices, automotive digital keys, wireless audio products, industrial IoT devices and edge AI terminals. Compared with Wired Interface IP, Wireless Interface IP depends not only on digital controllers and protocol compliance, but also on RF analog design, low-power architecture, radio coexistence, certification testing and mature protocol stacks, which results in fewer commercial suppliers and a more concentrated market.

The Wireless Interface IP market is driven by the expansion of IoT devices, convergence of smart home protocols, upgrades in low-power wireless connectivity, growing demand for automotive digital keys and precision positioning, and chip companies' need to lower the barrier to wireless R&D. IoT devices, wearables, wireless audio products, smart home devices and industrial sensors need to integrate Bluetooth, Wi-Fi, 802.15.4 and Thread/Matter connectivity under strict power and cost constraints, supporting continued adoption of low-power wireless IP. UWB adoption in smartphones, automotive digital keys, indoor positioning, access control and high-precision ranging increases the value of UWB PHY/MAC and related protocol stack IP. Cellular IoT, NB-IoT, LTE-M and Cat.1/Cat.4 also remain relevant in smart meters, asset tracking,

industrial terminals and lightweight wide-area connectivity. Because wireless IP requires RF design, protocol certification, radio coexistence, low-power management and long-term protocol stack maintenance, many chip companies prefer to license proven third-party Wireless Interface IP to shorten development cycles, reduce certification risk and improve multi-protocol integration efficiency.
