The global Wireless Liquid Level Collection Terminal market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The wireless liquid level collection terminal is a device used to monitor and collect liquid level data. It transmits the collected data to the monitoring center or control system through wireless communication technology. Wireless liquid level acquisition terminal usually consists of liquid level sensor, data acquisition module, wireless communication module and power module. Liquid level sensors are used to measure the height or pressure of liquids and convert the liquid level data into electrical signals. The data acquisition module is responsible for receiving the sensor signals and converting them into digital signals for processing and storage. The wireless communication module uses wireless technology (such as GPRS, NB-IoT, LoRa, etc.) to transmit the collected data to the remote monitoring center or control system to achieve real-time monitoring and remote control. The power module provides the power supply required by the terminal device.
