According to our (Global Info Research) latest study, the global Wireless Position Module market size was valued at US\$ 449 million in 2024 and is forecast to a readjusted size of USD 689 million by 2031 with a CAGR of 6.4% during review period.

The wireless position module is a modular component for the secondary integration of the baseband chip, GNSS chip, communication signal processor and other electronic components, and functional interfaces, and is responsible for sending and receiving signals, processing signals, reducing interference, and projecting positioning.

The demand for wireless position modules depends on the requirements of industries that rely on accurate positioning, such as manufacturing, warehousing, transportation, and agriculture. Automation in industries like robotics, manufacturing, and warehouses often requires precise positioning data, driving the demand for wireless positioning solutions. The growth of the Internet of Things (IoT) and its applications in asset tracking, indoor navigation, and location-based services can drive the demand for wireless position modules. The rollout of 5G networks can enable more robust and reliable wireless communication, potentially benefiting wireless positioning technologies that require real-time data transmission. Advances in wireless communication protocols, sensor technologies, and data processing algorithms can improve the accuracy, reliability, and cost-effectiveness of wireless position modules. The cost of wireless position modules and their compatibility with existing systems can influence their adoption in various industries. Regulations related to wireless communication and positioning technologies could impact the development and deployment of wireless position modules. The identification of new applications for wireless positioning, such as contactless payments, asset management, and location-based marketing, can open up

new market opportunities.
