## Abstracts

The global Wireless Slip Rings market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Wireless slip rings are a new type of product. They work on the principle of capacitive or inductive coupling for power and signal transmission by exciting the coils at high frequency without contact between the rotating and static components, which can also be separated by special materials if required. In general, they are less efficient than other solutions, and the loss of efficiency is directly proportional to the distance between the coupled components. In reality, this solution is not yet very wide spread. Its main benefits consist in the lack of wear and the possibility of configurations with a high seal/protection rating. On the other hand, they can transmit power only up to 150 W, have low efficiency and they require active electronics to excite the coil. Fieldbus data transmission is generally provided with a Wi-Fi or Bluetooth module integrated into the electronics. This means that each fieldbus connection requires its own module, and if no commercial solution is available it must be developed for the specific application. This type of slip ring may be used in niche applications characterised by high rotational speed and poor access for maintenance.

This report studies the global Wireless Slip Rings production, demand, key manufacturers, and key regions.
