Abstracts

According to our (Global Info Research) latest study, the global Wood Chip market size was valued at US\$ 10084 million in 2025 and is forecast to a readjusted size of US\$ 13718 million by 2032 with a CAGR of 4.4% during review period.

Wood Chips refer to small, thin pieces of wood produced by chipping logs, harvest residues, sawmill by-products, or fast-grown plantation wood using a chipper. Based on their end use, they are broadly classified into industrial chips (pulp chips) and fuel chips. Pulp chips are primarily used for pulp & paper manufacturing, wood-based panel production (medium density fiberboard, particleboard), and bio-refining, with strict specifications on particle size, thickness, and impurity content. Fuel chips are used for biomass boilers and power plants, and are graded under ISO 17225-4 (Solid biofuels ? Fuel specifications and classes ? Part 4: Graded wood chips) into four quality classes (A1, A2, B1, B2) and three size fractions (P16S, P31S, P45S). Wood chips are the core product category under HS 4401 and represent the largest single trade item in global primary processed wood products, with extensive applications in papermaking, panel products, bioenergy, horticulture mulch and related fields.

Wood chips represent the largest single trade item in global primary processed wood products, with price dynamics closely linked to pulp markets, energy policies, and freight costs. Significant value differentiation exists across species and end uses: hardwood chips for dissolving pulp command the highest premium, while bioenergy chips trade at the lowest unit value but experience the fastest demand growth due to global energy transition.

Gross margins vary considerably along the supply chain. Upstream companies with large-scale plantation forests and modern chipping facilities achieve relatively stable

margins through resource self-sufficiency and scale economies. Pure trading or toll-processing firms face thinner margins due to raw material price volatility and freight fluctuations. Major suppliers in the Southern Hemisphere benefit from long-term contracts and established customer relationships, enhancing their resilience.

Downstream, pulp and paper manufacturing accounts for the largest share of global wood chip consumption. Hardwood chips dominate printing paper and tissue grades, while softwood chips are essential for packaging papers (kraft liner, sack paper). In recent years, dissolving-grade chips have gained high-value status driven by viscose staple fiber demand. Bioenergy chip demand is growing rapidly in Europe and Northeast Asia, supported by subsidy policies encouraging coal-to-biomass fuel switching in power plants.

Incremental demand comes from two main sources. First, increasing integrated biorefinery projects linked to palm oil, rubber, and other commodities support steady industrial chip demand. Second, the EU Carbon Border Adjustment Mechanism and renewable energy directives are driving cross-regional trade in bioenergy chips, with Southeast Asian exports to Europe rising significantly.

The competitive landscape features concentrated supply in the Southern Hemisphere and fragmented consumption in the Northern Hemisphere. A small number of large plantation companies in Australia, Chile, South Africa, and Brazil control the majority of premium hardwood chip exports. Southeast Asian countries operate smaller-scale processing and export firms. China, as the world's largest wood chip importer, remains highly dependent on overseas supply, although state-owned enterprises such as China Forestry Group are expanding upstream through overseas plantation investments and long-term off-take agreements.

Key uncertainties include four factors. First, the alignment between global pulp capacity expansion and chip supply; new pulp line startups may cause periodic tightness and price spikes. Second, policy shifts on bioenergy subsidies, particularly in Europe and Northeast Asia, could alter long-term demand expectations for fuel chips. Third, geopolitical risks on key shipping routes (e.g., Red Sea) affecting freight costs and delivery reliability. Fourth, plantation area expansion is constrained by environmental and land-use policies, placing an upper limit on long-term supply potential.

Overall, the wood chip market will experience steady growth. Premium hardwood chips from eucalyptus and acacia will maintain a structural premium due to dissolving pulp demand, while fuel chips will expand rapidly in Europe and Northeast Asia driven by

energy transition policies. Companies with upstream plantation control and long-term contracts will continue to dominate, while smaller firms relying on spot procurement will face higher price and cost volatility.
