According to our (Global Info Research) latest study, the global Wood I-joists market size was valued at US\$ 2881 million in 2025 and is forecast to a readjusted size of US\$ 3968 million by 2032 with a CAGR of 4.7% during review period.

Wood I-Joists are lightweight, high-performance engineered wood structural members featuring an I-shaped cross-section composed of two horizontal flanges connected by a vertical web. The flanges are typically manufactured from Laminated Veneer Lumber (LVL), structural lumber, or other engineered wood materials and are designed to resist the primary bending stresses, while the web is commonly produced from Oriented Strand Board (OSB), plywood, or structural composite panels to transfer shear forces and maintain structural stability. By utilizing an optimized I-shaped design, Wood I-Joists provide a high strength-to-weight ratio, longer span capability, reduced material consumption, lower deflection, and improved dimensional stability compared with conventional solid wood beams. Wood I-Joists are widely used in residential wood-frame construction, floor systems, roof structures, wall framing, and prefabricated buildings, particularly in North America, Europe, Australia, and Japan. As a key component of modern engineered timber systems, Wood I-Joists offer an efficient, lightweight, and sustainable structural solution for timber-based construction. In 2025, the global Wood I-Joists market size is approximately \$2.8 billion, with an annual production volume of around 120 million meters, an average selling price of approximately \$23 per meter, and a gross profit margin of 30%.
