Wood log gasification boilers are advanced heating systems that utilize a process called gasification to burn wood logs more efficiently and cleanly. In these boilers, wood logs are heated in a low-oxygen environment to produce a combustible gas, which is then burned at high temperatures in a secondary chamber. This process significantly increases the efficiency of energy conversion, reduces emissions, and can provide a reliable source of heat. These boilers are often used in residential and commercial settings where sustainable and renewable energy sources are prioritized.
