Abstracts

The global Wood Powdered Activated Carbon market size is expected to reach \$ 1630 million by 2032, rising at a market growth of 4.6% CAGR during the forecast period (2026-2032).

Wooden powdered activated carbon is a powdery porous carbon material mainly made from wood chips, wood chips, sawdust, fruit wood or other woody biomass, and processed by carbonization, activation, acid washing, water washing, drying, crushing and screening. Common processes include phosphoric acid method, zinc chloride method, steam activation method and composite activation method. Its pore structure is well-developed, with a large specific surface area, fast adsorption rate, strong decolorization ability, low ash content, and relatively controllable impurities. It is mainly used in the fields of food and beverage decolorization, pharmaceutical refining, chemical intermediate purification, dye and pigment decolorization, water treatment, sewage deep treatment, flue gas adsorption, odor removal, catalyst carrier, and precious metal recovery. Compared with coal powder activated carbon, wooden powder activated carbon is usually more suitable for liquid-phase decolorization and adsorption of large molecular organic compounds, especially in the purification of sugar liquids, alcoholic beverages, oils, pharmaceutical intermediates, and fine chemical products. In 2025, global Wood Powdered Activated Carbon production reached approximately 481 K MT, with an average global market price of around US\$ 2,397 per MT.

Wooden powdered activated carbon belongs to the sub category of refined and highly decolorized applications in the activated carbon industry, with demand mainly driven by food and beverage, pharmaceuticals, fine chemicals, water treatment, and environmental governance. Around 2025, the requirements for low ash content, low heavy metals, high decolorization power, and batch stability in food processing,

pharmaceutical refining, and high-purity chemical industry will increase, driving the demand for high-quality wooden powder activated carbon to grow; At the same time, advanced sewage treatment, decolorization of industrial wastewater, adsorption of dioxins in flue gas, and emergency treatment of sudden water pollution also provide stable application space for powdered activated carbon. In terms of industry competition, the technical threshold for ordinary industrial grade products is relatively limited, and prices are greatly affected by the costs of sawdust, phosphoric acid, zinc chloride, steam, natural gas, electricity, and environmental treatment; Food grade, pharmaceutical grade, and high-purity low ash products rely more on raw material screening, pore size control, acid washing purification, heavy metal control, microbial control, and quality certification capabilities. Future opportunities mainly focus on high-end decolorization of food and beverage, refining of pharmaceutical excipients and raw materials, purification of electronic and fine chemicals, emergency dosing of urban water plants, upgrading and transformation of industrial wastewater, and utilization of green biomass resources. Enterprises with stable supply of wooden raw materials, clean production, environmental compliance, and customized adsorption performance development capabilities are more likely to obtain high value-added orders.
