Abstracts

The global Wood Thickness Planer market size is expected to reach \$ 147 million by 2029, rising at a market growth of 3.5% CAGR during the forecast period (2023-2029).

Thickness planers are woodworking machines used to trim wood boards to a consistent thickness throughout their length. They are being increasingly used across woodworking factories and homes for making rough wooden surfaces flat and smooth as well as to reduce their thickness. The traditional, adjusting of the thickness of wood boards was done by manual labor. Workers used their hands to trim wooden boards as well as to smooth their surfaces by means of various tools. This process used to take hours and was expensive. However, with the gradual advancement in technology, new tools like thickness planers were developed, which not only made this job easier but also reduced labor costs. Today, thickness planers have become standard tools used across homes and woodworking factories for creating parallel surfaces and adjusting the thickness of finished boards quickly. These machines trim wood with better precision and accuracy. The growing adoption of thickness planers by woodworkers and DIY enthusiasts for flattening and trimming wooden boards as per desired thickness is providing a major impetus to the growth of the thickness planers market and the trend is likely to continue in the future.

A wood thickness planer is worth its weight in gold for woodworkers, carpenters, and DIYers who salvage old pieces of wood, smooth existing lumber, and need to customize wood thickness. Designed specifically to handle bulk quantities of timber with two flat sides—referred to as S2S wood—these tools provide an even and plane cut.

This report studies the global Wood Thickness Planer production, demand, key manufacturers, and key regions.
