A wound component tester is a measuring instrument specifically designed to detect and analyze the performance of wound components. These components are usually wound by wire and have complex electrical characteristics. The wound component tester can accurately measure the electrical parameters of these components, such as inductance, DC resistance, number of winding turns, quality factor (Q value), leakage inductance and mutual inductance. These parameters directly affect the working performance of wound components in practical applications, such as their energy transmission efficiency, durability, anti-interference ability, etc.
