X-ray blood irradiator is a medical device that uses X-rays to irradiate blood. This therapy is also known as blood oxidation therapy or HOT. The concept behind this therapy is that exposing the blood to a small amount of X-ray radiation can stimulate the immune system, improve circulation, and increase the oxygen carrying capacity of red blood cells. X-ray blood irradiation instruments typically consist of a machine that generates X-rays, a control panel, and a chamber that exposes the patient's blood to radiation. During the surgery, a small amount of blood is extracted from the patient and circulated in the operating room, where it is exposed to X-rays. Then, the irradiated blood is sent back to the patient's body.
