The global X-Ray Protective Breast Shield market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The global market for X-ray protective equipment is expected to witness steady growth in the future due to the increasing number of patients undergoing medical imaging procedures. The demand for breast shields is expected to grow as well due to the rising awareness about the harmful effects of ionizing radiation on breast tissue. Furthermore, technological advancements in X-ray protective equipment are expected to drive market growth.

X-ray protective breast shield is a device used during medical imaging procedures, such as mammography, to protect the breast tissue from radiation exposure. It is a lead shield that is placed over the breast to block the radiation, reducing the amount of radiation that reaches the breast tissue. The shield is designed to be comfortable and flexible, allowing for proper positioning during the imaging procedure. The use of X-ray protective breast shields is recommended by many medical organizations to reduce the risk of radiation-induced breast cancer.
