According to our (Global Info Research) latest study, the global X-ray Skeletal Age Instrument market size was valued at US\$ 46.2 million in 2024 and is forecast to a readjusted size of USD 77.3 million by 2031 with a CAGR of 8.2% during review period.

The X-ray skeletal age instrument uses X-rays to image specific parts (such as metacarpal bones, wrist bones, etc.), and then analyzes and evaluates the individual's skeletal development to determine the age of the bones, that is, bone age. The working principle of the X-ray skeletal age instrument is based on radiological technology. It first uses X-rays to take high-definition images of the examined parts, and then inputs these images into the computer, and uses specific software to analyze indicators such as bone shape, size, density, and development. The software will compare these indicators with domestic youth standards or international general algorithms to ultimately determine the subject's bone age.
