Abstracts

The global Xenotransplantation Pathogen Testing Panel market size is expected to reach \$ 142 million by 2032, rising at a market growth of 20.5% CAGR during the forecast period (2026-2032).

A xenotransplantation pathogen testing panel is a multi-target safety testing combination for porcine or other animal-derived cells, tissues, organs, and recipient samples. It uses qPCR/ddPCR, multiplex PCR, serology, cell-based infectivity assays, and metagenomic NGS to cover risk factors such as PERV, PCMV/PRV, PLHV, PCV, PPV, HEV, influenza viruses, bacteria, fungi, and parasites, supporting source animal screening, pre-transplant release, post-transplant infection monitoring, and clinical trial biosafety assessment. Products are usually delivered as custom target panels, validated testing services, or research-use kits, with emphasis on low detection limits, cross-sample compatibility, positive and negative controls, method validation, GMP/GLP compliance, and data traceability, with an overall gross margin of about 55%.

As xenotransplantation moves from preclinical validation into early clinical studies, DPF/SPF management of donor pig herds, pre-procurement release testing, long-term recipient follow-up, and biospecimen archiving for exposed groups are shifting pathogen testing from single PERV or PCMV assays toward multi-target, stage-based safety monitoring programs. Demand is concentrated on porcine viruses, zoonotic viruses, bacteria, fungi, and parasites, while also requiring coverage across donor animals, organ perfusate, recipient blood, and tissue samples.

Product upgrades are moving from single PCR assays and conventional 9 CFR adventitious virus testing toward combined delivery of targeted qPCR/ddPCR, metagenomic NGS, serology, and cell-based infectivity assays. Leading suppliers are

mainly biosafety testing CROs, veterinary diagnostic laboratories, and molecular diagnostic reagent companies, with competition centered on validated target libraries, detection limits, turnaround time, regulatory acceptance, and customization capability.

Market opportunities mainly come from gene-edited pig organ programs in the United States, China, and Europe, clinical research in xenogeneic skin, islet, and kidney transplantation, and continued monitoring of source animals and recipient samples by pharmaceutical and biotechnology sponsors. Key risks include the limited number of clinical programs, evolving standardization, insufficient validation for some porcine pathogen methods, and the difficulty of interpreting NGS results while controlling background contamination.
