According to our (Global Info Research) latest study, the global XML Databases Software market size was valued at USD 341.6 million in 2023 and is forecast to a readjusted size of USD 529.5 million by 2030 with a CAGR of 6.5% during review period.

XML Databases Software is a type of software that allows data to be stored, retrieved, and manipulated in XML format. XML stands for Extensible Markup Language, which is a standard way of encoding data in a human-readable and machine-readable format. XML Databases Software can be classified into two categories: native XML databases and XML-enabled databases. Native XML databases store data as XML documents and use XML-specific query languages such as XQuery or XPath to access the data. XML-enabled databases store data in a relational or other format and use a mapping layer to convert the data to and from XML.

The industry trend of XML Databases Software is influenced by the increasing demand for handling complex and heterogeneous data sources, such as web services, social media, IoT devices, and cloud applications. XML Databases Software can provide advantages such as flexibility, interoperability, scalability, and performance for managing such data. Some of the factors that are expected to drive the market growth are:

The popularity of XML as a standard format for data exchange and representation across various domains and applications

The development of new technologies and standards that enhance the capabilities and

functionalities of XML Databases Software, such as JSON, RDF, SPARQL, and XSLT 3.0

The emergence of new use cases and applications that require processing large volumes of semi-structured or unstructured data, such as text analytics, natural language processing, semantic web, and machine learning

The increasing adoption of cloud-based and open source solutions that offer lower cost, higher scalability, and easier integration with other systems
