According to our (Global Info Research) latest study, the global Ytterbium-176 market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Ytterbium-176 is a stable isotope used as starting material to produce Lutetium-177, which is used to treat prostate and other cancers with high success. Historically, Russia has been the world's primary producer of this isotope whose supply chain is fragile and inadequate to meet world demand.

Radioisotopes are the unstable form of an element that emit radiation to transform into a more stable form. Radiation is easily traceable and can cause changes in the substance it falls upon. These special attributes make radioisotopes useful in medicine, industry and other areas. Most radioisotopes are artificially produced in research reactors and accelerators by exposing a target material to "intense particles," such as neutrons or protons, followed by different chemical processes to bring them into the required chemical form.
