Yttrium oxide (Y₂O₃) is another material with a cubic structure that can be used on pipes for discharge lamps or heat-resistant windows due to its corrosion resistance, thermal stability and transparency in a wide range of the electromagnetic spectrum. Transparent yttria ceramics have found potential applications, such as luminous pipes for high-intensity-discharge lamps, heat-resistive windows and transparent armours due to their excellent properties, such as high corrosion resistivity, thermal stability and transparency over a wide wavelength region from violet to infrared light. Recently, transparent yttria ceramics were extensively studied as a host material for scintillators and solid-state lasers. Similarly as other transparent polycrystalline materials, yttria ceramics have an advantage over single crystals owing to easier mass production, possibility of fabrication large size elements, lower preparation cost and higher doping concentration in the case of laser materials.
