According to our latest research, the global Zeolite Membrane Dehydration System market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Zeolite Membrane Dehydration System is a specialized separation technology that utilizes microporous zeolite membranes to selectively remove water from various mixtures, including organic solvents, gases, and biofuels. The system operates through mechanisms like pervaporation or vapor permeation, where water is separated by passing through the zeolite's porous structure, leaving other components behind. This technology is widely used in industrial applications such as chemical processing, biofuel production, and gas dehydration, offering high efficiency and selectivity in water removal.
