## Abstracts

Zeolite molecular sieves are crystalline, highly porous materials, which belong to the class of aluminosilicates and are available in the form of beads, pellets and powder. These crystals are characterised by a three-dimensional pore system, with pores of precisely defined diameter. The corresponding crystallographic structure is formed by tetrahedras of (AlO<sub>4</sub>) and (SiO<sub>4</sub>).

Molecular sieves are available in four primary generic forms, 3A, 4A, 5A and 13X. Each form has its own specific properties and applications, and all retain a polar preference for adsorption of water.

Scope of the Report:

This report focuses on the Zeolite Molecular Sieve in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

At present, in Europe and USA, the zeolite molecular sieve industry is generally at a more advanced level. The world's large enterprises are mainly concentrated in these regions.
