According to our (Global Info Research) latest study, the global Zero Emission Buildings market size was valued at USD 23940 million in 2023 and is forecast to a readjusted size of USD 97440 million by 2030 with a CAGR of 22.2% during review period.

A zero emission building is a building with zero net energy consumption, meaning the total amount of energy used by the building on an annual basis is roughly equal to the amount of renewable energy created on the site, or in other definitions by renewable energy sources elsewhere. These buildings consequently contribute less overall greenhouse gas to the atmosphere than similar non-ZNE buildings. They do at times consume non-renewable energy and produce greenhouse gases, but at other times reduce energy consumption and greenhouse gas production elsewhere by the same amount.

The earth's climate is worsening, owing to the unprecedented and unchecked emission of greenhouse gases since the beginning of industrial revolution. This is causing the global average temperature to rise, eventually leading to various issues such as global sea level rise, crop failure, untimely season change, worsening of air quality, and other environment related issues. This alarming fact has brought every nation together to stop the unchecked emission of greenhouse gases and bring back the earth's environment to its original state as much as possible. Zero emission buildings are constructed, as a zero-emission building consumes only the electricity that is typically generated via renewable resources. This is expected to play a major role in reducing the global CO₂ emissions in the coming years. Such factors are expected to positively influence the zero emission buildings market growth in the coming years.
