According to our (Global Info Research) latest study, the global Zinc-Air Buttoncells market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Zinc-air buttoncells are a type of electrochemical battery that utilizes the reaction between zinc and oxygen from the air to generate electrical energy. These button cells are characterized by a design featuring a porous zinc anode and a cathode containing a material that facilitates the oxygen reduction reaction. The battery is activated when a seal is removed, allowing air to enter and initiate the chemical reaction. Zinc-air button cells are commonly used in hearing aids, watches, and other small electronic devices due to their high energy density and relatively long shelf life. They offer a lightweight and compact power source with the advantage of being able to draw power directly from the surrounding air, eliminating the need for a traditional electrolyte solution within the cell.
