Abstracts

The global Zirconium Carbonate market size is expected to reach \$ 59.87 million by 2032, rising at a market growth of 4.7% CAGR during the forecast period (2026-2032).

Zirconium carbonate refers to an inorganic zirconium compound that is commercially supplied mainly as basic zirconium carbonate, hydrated zirconium carbonate or reactive zirconium carbonate. Zirconium carbonate is an important basic zirconium chemical, which offers good reactivity, acid solubility and controllable impurity levels, and can be further used to produce zirconium acetate, zirconium sulfate, ammonium zirconium carbonate, potassium zirconium carbonate, zirconium catalyst precursors, coating and ink additives, and ceramic-related materials. In 2025, global zirconium carbonate sales volume is estimated at around 11,500 tons, with a average selling price of approximately USD 3,800 per ton.

The zirconium carbonate value chain consists of upstream zircon sand, zirconium oxychloride, zirconium sulfate, sodium carbonate or ammonium carbonate, ammonia and process water.

Demand for zirconium carbonate is supported by downstream zirconium chemical processing, environmentally friendly coating and ink additives, catalyst precursors, raw materials for paper coating crosslinkers and high-performance ceramic materials. As waterborne coatings, chromium-free surface treatment, low-VOC inks and functional materials continue to develop, zirconium carbonate remains a stable basic zirconium salt intermediate due to its good reactivity and ease of conversion into downstream zirconium compounds. Demand for ammonium zirconium carbonate and potassium zirconium carbonate in paper coating and water-based systems also indirectly supports consumption of upstream zirconium carbonate raw material.

This report studies the global Zirconium Carbonate production, demand, key manufacturers, and key regions.
