Abstracts

The global Zirconium Sponge and Hafnium Sponge market size is expected to reach \$ 482 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032).

In 2025, global Zirconium Sponge and Hafnium Sponge production reached approximately 9,300 tons, with an average global market price of around US\$39 per kilogram. Zirconium sponge is a porous, sponge-like form of metallic zirconium produced by the magnesium reduction of zirconium tetrachloride (Kroll process). It has a rough surface and high porosity. Due to its low neutron absorption cross-section, excellent corrosion resistance, and high-temperature stability, it is primarily used as cladding and structural material in nuclear reactors, as well as in chemical and metallurgical industries. Hafnium sponge is a porous, sponge-like form of metallic hafnium obtained by magnesium reduction of hafnium tetrachloride. It features a high thermal neutron absorption cross-section, making it ideal for nuclear reactor control rods to regulate fission rates. It is also employed in plasma cutting, high-temperature alloys, and other demanding applications due to its heat and corrosion resistance.

The global zirconium sponge and hafnium sponge market maintains stable operations. On the supply side, production technologies have long been mastered by only a few countries, creating high entry barriers and a relatively concentrated global production capacity. In recent years, ongoing progress in capacity expansion and zirconium-hafnium separation technologies has strengthened the supply base. On the demand side, the nuclear energy sector remains the most stable source of demand. As a key raw material for nuclear fuel cladding and structural components, zirconium sponge sees steady demand growth driven by the global expansion of nuclear power capacity. Hafnium sponge, with its high thermal neutron absorption cross-section, is widely used

in nuclear reactor control rods. Additionally, demand for hafnium sponge is growing in high-end manufacturing fields such as the semiconductor industry. Zirconium and hafnium are often found together in the same mineral deposits, requiring separation during production, which links the output rhythm of the two metals. From a competitive landscape perspective, companies with zirconium-hafnium separation capabilities hold a core position in the global market. Supply stability continues to be influenced by raw material availability, energy costs and trade policies. Overall, the supply and demand structure of the global zirconium sponge and hafnium sponge market remains solid, with nuclear power policy guidance set to shape the operational logic of both markets over the medium and long term.
