Abstracts

According to our (Global Info Research) latest study, the global Gold Nanoshells market size was valued at US\$ 61.74 million in 2025 and is forecast to a readjusted size of US\$ 111 million by 2032 with a CAGR of 8.8% during review period.

Gold nanoshells are core-shell structured nanomaterials, typically consisting of a core of dielectric material (such as silica) nanospheres coated with a thin gold shell. By adjusting the size of the core and the thickness of the gold shell, their optical properties (such as surface plasmon resonance peaks) can be precisely controlled, giving them strong absorption or scattering characteristics in the near-infrared band. The core demand stems from the urgent pursuit of precise, low-invasive integrated diagnostic and therapeutic technologies in the biomedical field, particularly in targeted photothermal therapy and multimodal imaging of tumors. The upstream supply chain is concentrated in the high-purity specialty chemicals and precision materials industry, involving the production and purification of key raw materials such as gold salt precursors, monodisperse silica microspheres, surfactants, and silane coupling agents. The downstream supply chain directly connects with biopharmaceutical companies and research institutions, integrating gold-shell nanoparticles as core functional materials into tumor treatment equipment, molecular diagnostic reagents, high-end biochips, and research tools. In 2025, the production of gold nanoshells is approximately 300 kg, with an average selling price of approximately US\$200/gram, a gross profit margin of approximately 55%, and a single-line production capacity of approximately 8 kg/year.
