Abstracts

According to our (Global Info Research) latest study, the global Halopyridines market size was valued at US\$ 1299 million in 2025 and is forecast to a readjusted size of US\$ 1964 million by 2032 with a CAGR of 6.1% during review period.

Halopyridines are a family of nitrogen-containing heteroaromatic compounds in which one or more hydrogen atoms on the pyridine ring are replaced by halogen atoms such as fluorine, chlorine, bromine or iodine. Because of the strong C–X bond and the electron-withdrawing nature of halogens on the ring, halopyridines show characteristic reactivity in nucleophilic aromatic substitution, metal-catalyzed cross-coupling and pyridyne chemistry, and are widely used as versatile synthetic building blocks.

Upstream, industrial halopyridines are mainly made by halogenation of pyridine or pyridine derivatives. Modern routes include direct C–H halogenation of pyridines using designed phosphine reagents followed by displacement with halide nucleophiles, as well as Zincke-type halogenation strategies that selectively introduce halogens at the 3-position. Downstream, halopyridines are recognized as key building blocks for synthesizing pharmaceuticals, agrochemicals and ligands for metal complexes.

In 2025, global sales of halopyridines reached approximately 285 K tons, with an average global market price of around US\$ 4,435/ton. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 15% to 30%.
