The harmless disposal of hazardous waste refers to the treatment of wastes with hazardous characteristics such as toxicity, corrosivity, flammability, reactivity and infectivity through a series of scientific, reasonable and effective technologies and methods, to eliminate or reduce the harm to the environment and human health and achieve a safe, stable and pollution-free state. It includes but is not limited to physical, chemical, biological and other treatment methods, as well as final disposal means such as incineration, landfill and solidification.

The harmless disposal of hazardous waste is a crucial environmental protection task. It targets those wastes with severe hazardousness, such as industrial waste residues containing heavy metals, infectious wastes in the medical field, etc. Through the application of advanced and compliant technologies and processes, including physical separation and compression, chemical neutralization and transformation, biological degradation treatment, as well as final means such as incineration, landfill, and solidification, hazardous wastes are transformed into forms that are harmless or have significantly reduced hazards to the environment and human health, thereby ensuring ecological balance and public health and promoting sustainable development.
