## Abstracts

According to our (Global Info Research) latest study, the global Helium-free Magnetoencephalography market size was valued at US\$ 10.2 million in 2024 and is forecast to a readjusted size of USD 75.4 million by 2031 with a CAGR of 33.4% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The liquid helium-free magnetoencephalogram is a new type of brain functional imaging device that uses superconducting sensors to detect the weak magnetic fields generated by brain activity and is used to non-invasively monitor brain electrical activity. Unlike traditional magnetoencephalograms, this instrument does not require the use of cryogenic liquid helium for cooling, but instead uses zero magnetic field cooling technology or new solid-state sensors such as superconducting quantum interference devices (SQUIDs) or spin dispersion magnetometers (Optically Pumped Magnetometers, OPMs). This design makes the device more compact, more energy-efficient, and easy to use, making it suitable for more clinical environments and scientific research applications.

This report is a detailed and comprehensive analysis for global Helium-free Magnetoencephalography market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
