## Abstracts

According to our (Global Info Research) latest study, the global High Purity Fused Calcium Oxide market size was valued at US\$ 98 million in 2025 and is forecast to a readjusted size of US\$ 150 million by 2032 with a CAGR of 6.3% during review period.

High purity fused calcium oxide refers to a high-purity, high-density, and low-reactivity calcium oxide product made by melting high-purity limestone or calcium carbonate in an electric arc furnace at extremely high temperatures (>2500°C), followed by cooling, solidification, crushing, and sieving. Its core value lies in achieving extremely high chemical and physical stability through a physical melting process, making it an ideal aggregate for preparing high-performance alkaline refractory materials. The upstream supply chain begins with high-purity limestone/calcium carbonate mines and manufacturers of large-scale electric arc melting equipment; the midstream core consists of specialty material manufacturers who master electric arc melting and crystallization control technologies. Downstream, it primarily flows to high-end alkaline refractory material manufacturers as a key aggregate for preparing calcium oxide-based ramming mixes and linings. The demand fundamentally stems from the aerospace and high-end medical fields' pursuit of extreme performance in active metal alloys such as titanium and zirconium. These metals must be melted in a vacuum furnace with calcium oxide linings, and the erosion resistance and stability of the lining are directly determined by the purity and density of the fused calcium oxide aggregate. In 2024, the production of high purity fused calcium oxide was approximately 15,000-25,000 tons, with an average selling price of approximately US\$3,000-6,000 per ton, a gross profit margin of approximately 40%, and a single production line capacity of 1,000-3,000 tons per year.
