Human IVF media and oils are specialized solutions used in in vitro fertilization (IVF) to support the growth, development, and manipulation of gametes (sperm and eggs) and embryos outside the human body. IVF media are nutrient-rich liquids designed to mimic the natural environment of the reproductive tract, providing essential nutrients, growth factors, and pH balance necessary for the fertilization and early development of embryos. These media are used at various stages of the IVF process, including oocyte retrieval, fertilization, embryo culture, and cryopreservation. IVF oils, such as mineral oil, are used to overlay culture media in petri dishes to prevent evaporation, maintain stable temperature and pH levels, and protect embryos from contaminants. The use of high-quality IVF media and oils is crucial for optimizing the conditions for fertilization and embryo development, thereby increasing the chances of successful pregnancy outcomes in assisted reproductive technologies.
