Human Skeleton Anatomical Model is a detailed, often life-sized, replica of the human skeletal system, typically used for educational, medical, and research purposes. These models are designed to accurately represent the bones and anatomical features of the human body, allowing users to study and understand the structure, function, and relationships of the skeletal system. Human Skeleton Anatomical Models can be articulated, where the bones are connected to mimic natural joint movements, or disarticulated, where the bones are separated for individual examination. They serve as essential tools in anatomy education, medical training, patient education, and scientific research.
