According to our (Global Info Research) latest study, the global Humanoid Robots Metal Materials market size was valued at US\$ 2.47 million in 2025 and is forecast to a readjusted size of US\$ 60.45 million by 2032 with a CAGR of 50.8% during review period.

In 2025, global Metal Materials for Humanoid Robots capacity 800 Tons, sales reached approximately 750 Tons, with an average market price of around 3,200 USD/Ton, industrial gross margin 26%.

Metal Materials for Humanoid Robots define “light, strong, durable, and cool.” They set the stiffness-to-weight and vibration envelope of the main frame, the fatigue life and noise floor of joint transmissions, and the power density and thermal headroom of motors. As humanoid programs move from prototypes to repeatable builds, Metal Materials for Humanoid Robots are judged less by peak lab numbers and more by whether performance can be delivered consistently through scalable routes—stable die casting/forging windows, predictable heat treatment distortion, controllable machining capability, and traceable quality.

A practical bill-of-materials view breaks Metal Materials for Humanoid Robots into three layers. (1) Lightweight structures: aluminum alloys (6061/7075 families) remain the workhorse for extrusions, CNC, and high-pressure die casting; magnesium alloys are pulled in for additional mass reduction once corrosion protection and process stability are proven; titanium alloys appear selectively where high fatigue resistance and high specific strength justify the cost. Core parameters are density (Al ~2.7 g/cc; Mg ~1.7 g/cc), fatigue strength, corrosion behavior, and surface-treatment headroom. (2)

Precision transmission: bearing steels, gear steels, and carburizing steels dominate; the value drivers are cleanliness (inclusions), heat-treat distortion control, raceway/gear contact fatigue, and grindability. (3) Drive & electromagnetic: non-oriented electrical steel, copper, and NdFeB magnets dominate; the key metrics are core loss, lamination thickness, magnet coercivity/thermal stability, and irreversible demagnetization risk under high-frequency control.

The industrial chain starts upstream (Al/Mg/Ti producers, specialty steelmakers, copper refiners, rare-earth mining/separation and magnet materials), moves through semi-finished forms (sheet/extrusion, die castings/forgings, powders and powder-metallurgy parts), and then through machining, heat treatment, and surface engineering (anodizing/MAO, nitriding, DLC/PVD, etc.) before flowing into joint modules, reducers/ball screws, servo motors, and final assembly. Representative players can be read as “materials + critical components”: Alcoa/Novelis and China Hongqiao/Chalco in aluminum; Baowu Magnesium and Yunhai Metals in magnesium; Baowu and Nippon Steel in specialty steel; SKF and NSK in bearings; Harmonic Drive and Nabtesco in high-precision reduction/actuation chains—each directly shaping alloy specs, process windows, and qualification rules.

Commercialization signals are increasingly visible through designated procurement and framework agreements that pull metal processes into real delivery cadence. On 8 Dec 2025, Lizhong Group disclosed a designated procurement agreement with Beijing Weijing Intelligence for humanoid-robot machined components: 5,000 sets over five years with an estimated contract value of about RMB 75 million, covering items such as the main skeleton, shoulder joints, and dexterous-hand structures. The strategic message is that “metal capability” is being locked in early: material selection, casting/forging routes, machining baselines, and inspection standards are being frozen into repeatable supply, which is exactly what the Metal Materials for Humanoid Robots stack needs to cross from engineering builds to scalable production.

Into late-2025, Metal Materials for Humanoid Robots are shifting from “which alloy” to “which process platform and which resilient supply chain.” Three 2025 developments illustrate the direction: on 10 Jul 2025, a U.S. defense-related agency and MP Materials advanced a public-private partnership to accelerate domestic rare-earth magnet capability; on 15 Jul 2025, MP Materials and Apple announced a US\$500 million partnership centered on recycled rare-earth magnets; on 9 Oct 2025, China’s Notice No. 61 expanded export controls to specified rare-earth items and products containing rare-earth permanent magnets, while late Oct 2025 saw Lynas announce investment to expand heavy rare-earth separation capacity in Malaysia. For humanoid programs, the

implication is clear: dual-sourcing, localization, and recycling become design constraints, not afterthoughts. Growth concentrates in (i) integrated castings and thin-wall structural design (plus a measured shift toward magnesium as corrosion and quality stability mature), (ii) cleaner steels and longer-life raceway/gear surface engineering, and (iii) thinner electrical steel for high-frequency operation and magnet recipes that reduce heavy-rare-earth reliance while improving high-temperature stability.
