Hyperthermia therapy for cancer, also known as thermal therapy or thermotherapy, is a type of treatment in which body tissue is exposed to high temperatures (up to 113°F or 45°C) to damage and kill cancer cells. This approach can enhance the effectiveness of other treatments such as radiation therapy and chemotherapy. Hyperthermia is typically used to treat tumors located in specific parts of the body, such as the chest, liver, or limbs. The heat can be applied using various techniques, including external applicators, internal probes, or perfusion methods where heated substances are circulated through the body. The primary goal is to target cancer cells while minimizing damage to surrounding healthy tissue.
