Immunoglobulin Ribonucleic Acid of Anti Hepatitis B for Injection is a new type of biological preparation developed based on RNA technology, specifically used for the adjuvant treatment of hepatitis B virus infection. The drug is prepared by extracting and purifying mRNA from memory T cells with specific immune responses to hepatitis B virus (HBV) in patients in the recovery period, and then using in vitro transcription and other processes. Its mechanism is to reactivate the patient's own immune system and enhance the body's ability to recognize and eliminate hepatitis B virus, thereby achieving the purpose of inhibiting viral replication and promoting liver function recovery.
