Implantable deep brain stimulation electrode leads are high-tech medical devices used to treat neurological diseases. They are implanted into specific areas of the brain for electrical stimulation to regulate and restore neural function. The electrode leads are usually made of highly biocompatible and durable materials, with multiple electrode contact points at the end of the lead to provide precise electrical stimulation. Extension cords transmit electrical stimulation signals from the IPG to the electrode leads in the brain. The IPG is usually implanted subcutaneously in the chest or abdomen to generate and regulate electrical stimulation pulses.
