According to our (Global Info Research) latest study, the global Implantable Leadless Pacemaker market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

An implantable leadless pacemaker is a type of cardiac pacing device that differs from traditional pacemakers in that it does not require leads (thin, insulated wires) to be inserted into the heart's chambers. Instead, it consists of a small, self-contained unit that is directly implanted into the heart muscle. The leadless pacemaker typically consists of a pulse generator, battery, and electrodes all contained within a single, small device. This eliminates the need for traditional leads and reduces the risk of lead-related complications such as dislodgement or fracture. Like traditional pacemakers, the leadless pacemaker monitors the heart's rhythm and delivers electrical impulses when necessary to maintain a regular heartbeat. However, its design offers advantages such as a smaller size, less invasive implantation procedure, and potentially lower risk of complications. Healthcare providers can still adjust the settings of the leadless pacemaker and monitor the heart's activity using external programming devices, similar to traditional pacemakers.
