Abstracts

According to our (Global Info Research) latest study, the global Inactive Edible Yeast market size was valued at US\$ 746 million in 2025 and is forecast to a readjusted size of US\$ 1061 million by 2032 with a CAGR of 5.1% during review period.

Inactive yeast is inert yeast or inactivated yeast, which is inactivated by heating or pH changes. At the same time, the endogenous enzymes of the yeast autolyse without adding any antibiotics. Inactive yeast contains cell walls, zymosan (especially glycoproteins such as mannoproteins), minerals, trace elements, sterols, unsaturated fatty acids, glutathione, etc. Inactive yeasts have good effects in the activation of active dry yeast, alcoholic fermentation, malolactic fermentation and later aging of wine.

Inactive edible yeast is a nutrient-rich food supplement made from cultured, inactivated and dried *Saccharomyces cerevisiae*. Unlike active yeast, this yeast powder does not trigger fermentation reactions and retains certain nutritional value and flavor properties, so it is a green and safe food that does not irritate the gastrointestinal tract. The inactive edible yeast produced by our company is a light yellow powder product with a natural yeast flavor. In 2025, global Inactive Edible Yeast production reached approximately 83.85 K MT, with an average global market price of around US\$ 8,654 per MT. The annual production capacity of inactive edible yeast is 120,000 tons, with a gross profit margin of about 25%.

Upstream raw materials: molasses, glucose syrup, starch sugar, nitrogen and phosphorus sources, trace elements and vitamins, process water.

Upstream auxiliary materials and supporting materials: defoaming agents, filter aids,

cleaning and disinfection chemicals, etc.

Downstream applications: food ingredients and flavoring, baking and cereal products, plant-based foods, health foods and nutritional fortification, catering and prepared dish systems.

The raw material cost is 65%, the manufacturing cost is 25%, and the labor cost is 10%.
