Abstracts

According to our (Global Info Research) latest study, the global Indoor Environment Sensors market size was valued at US\$ 7141 million in 2024 and is forecast to a readjusted size of USD 11150 million by 2031 with a CAGR of 6.6% during review period.

Indoor environment sensors are devices that are used to monitor and measure various parameters of the indoor environment. These sensors are typically installed in buildings, homes, offices, or other indoor spaces to ensure the comfort, health, and safety of occupants. Some common types of indoor environment sensors include:

1. **Temperature sensors:** These sensors measure the ambient temperature of the indoor space. They are used to maintain a comfortable temperature and control heating, ventilation, and air conditioning (HVAC) systems.
2. **Humidity sensors:** Humidity sensors measure the moisture content in the air. They help maintain optimal humidity levels for comfort and prevent issues such as mold growth or excessive dryness.
3. **Carbon dioxide (CO₂) sensors:** CO₂ sensors monitor the concentration of carbon dioxide in the air. High levels of CO₂ can indicate poor ventilation and can lead to discomfort, drowsiness, or even health problems. These sensors are commonly used in buildings to ensure adequate ventilation.
4. **Air quality sensors:** Air quality sensors measure various pollutants and contaminants in the indoor air, such as volatile organic compounds (VOCs), particulate matter, or

gases like carbon monoxide (CO). They help identify and mitigate potential health risks and ensure a healthy indoor environment.

5. Light sensors: Light sensors measure the intensity of light in an indoor space. They are used to control lighting systems, optimize energy usage, and provide appropriate lighting levels for different activities.

6. Noise sensors: Noise sensors measure the ambient noise levels in an indoor environment. They can help identify excessive noise levels that may affect occupant comfort or indicate potential issues with noise pollution.

7. Occupancy sensors: Occupancy sensors detect the presence or absence of people in a room or area. They are used to control lighting, HVAC systems, or security systems, ensuring energy efficiency and occupant comfort.

These sensors can be standalone devices or integrated into building automation systems to provide real-time data, enable remote monitoring and control, and facilitate data analysis for better indoor environment management.
