Abstracts

According to our (Global Info Research) latest study, the global Industrial Radiography and CT System market size was valued at US\$ 3201 million in 2024 and is forecast to a readjusted size of USD 4507 million by 2031 with a CAGR of 5.0% during review period.

Both industrial X-ray inspection and industrial computed tomography are among the imaging methods used in materials testing.

Non-destructive materials testing using X-rays is used to visualise internal structures of materials such as metals, plastics, ceramics and composites. X-ray images are two-dimensional and show the absorption of X-rays by the material, revealing information about the density, thickness and shape of objects. X-rays are often used to identify defects such as cracks, porosity or inclusions in materials and are widely used in many industrial applications, such as quality control of welds, castings or electronic components.

AI-based systems can be used in automated X-ray inspection systems to detect and analyse defects. Special algorithms are trained to recognise and classify different types of defects.

Industrial computed tomography is an advanced method that uses a combination of X-rays and computer algorithms to create three-dimensional images of materials. CT scanners capture a variety of X-ray images from different angles around the material and then use special software to reconstruct these images into a detailed three-dimensional representation of the material. Industrial CT makes it possible to analyse internal structures of materials in high resolution and create 3D models to visualise complex geometries, defects and internal features of components or workpieces. With CT, much more data can be collected about the component. This makes it possible to better assess component quality. X-rays, for example, can quickly reach their limits

when overlaying geometries, structures or defects. CT, on the other hand, plays to its strengths here and is thus particularly suitable for safety-relevant components. Due to the high accuracy of industrial CT, it is often used in non-destructive testing (NDT) to check dimensions, inspect assemblies and joints or identify defects such as cracks, porosity, delamination and inclusions in complex components or composite materials. Industrial CT is used in various industries such as aerospace, automotive, electronics and medical.

Similar to industrial X-ray inspection, AI-based systems can be used in industrial CT to automate the evaluation of CT results and thus significantly speed up the inspection.
