Infant transcutaneous oxygen monitors are medical devices designed to measure the oxygen levels in an infant's blood non-invasively, by assessing the amount of oxygen diffused through the skin. These devices are commonly used in neonatal and pediatric care, especially in preterm infants or those with respiratory conditions. They typically use sensors that are placed on the skin, often on the infant's foot or chest, to measure transcutaneous oxygen tension (tcPO₂) and carbon dioxide levels (tcPCO₂).
