Abstracts

According to our (Global Info Research) latest study, the global Infrared Night Vision Camera market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Night vision cameras often use infrared, because low light imaging used by night vision cameras is not clear enough and cannot provide long-distance detecting in total darkness at night, but infrared cameras can. The biggest advantage of infrared cameras is that it is much better at spotting and tracing objects. Visible light devices and night vision cameras with low light imaging cannot see the target hidden in the grass or forest. However, with infrared cameras, the infrared radiation of the targets which stands for heat would go through the covering material and can be clearly seen.

The market for Infrared Night Vision Cameras is rapidly growing, catering to a wide range of security and surveillance needs, especially in military, law enforcement, wildlife observation, and nighttime security sectors. The market size continues to expand with steadily increasing sales, partly due to continuous technological advancements that enhance the performance of these cameras. Additionally, specific uses of Infrared Night Vision Cameras are diversifying, including applications in drones, smart home security systems, and agriculture. Future developments are expected to focus on higher resolutions, larger coverage areas, lower costs, and more intelligent features to meet the ever-growing market demands.
