Injectable Demineralized Bone Matrix (DBM) Paste is a biomaterial used in orthopedic and dental surgeries to promote bone regeneration and repair. It is composed of demineralized bone matrix, which is derived from allograft (donated human) bone that has been processed to remove its mineral content while preserving its collagen and non-collagenous proteins. These proteins, particularly growth factors like Bone Morphogenetic Proteins (BMPs), play a crucial role in stimulating new bone formation.

The paste form allows for easy injection into bone defects or cavities, making it a versatile and minimally invasive option for enhancing bone healing. Injectable DBM paste is commonly used in spinal fusion surgeries, fracture repair, and periodontal procedures. It can be combined with other graft materials or used alone, depending on the clinical requirements. The paste is typically biocompatible, osteoinductive (capable of inducing new bone formation), and resorbable, meaning it is gradually replaced by new bone tissue over time.
