The Injection Structure Integrity Tester is a type of testing equipment used to assess the internal quality of grouting, cast-in-place piles, and concrete filling layers without damaging the building or civil structure. It uses technologies such as ultrasound, sound wave transmission, radar, electromagnetic induction, and infrared imaging to identify and locate defects such as density, cracks, voids, mud inclusions, and incomplete filling within the structure, helping engineers determine whether the grouting quality meets standards. This equipment is widely used in pile foundation testing, tunnel lining, foundation reinforcement, bridge and underground structure engineering, providing reliable data for project quality acceptance, maintenance, and safety assessment. In 2024, sales reached 229,000 units, with an average price of \$680 per unit. Total production capacity was approximately 260,000 units. The gross profit margin was 52%.
