According to our (Global Info Research) latest study, the global Inorganic Chemical Foaming Agents market size was valued at US\$ 1424 million in 2024 and is forecast to a readjusted size of USD 2339 million by 2031 with a CAGR of 7.3% during review period.

Inorganic chemical foaming agents are chemical substances of inorganic origin that are employed to create a foamed structure within materials. They function by decomposing or reacting under specific conditions, such as exposure to heat or certain chemical environments, to release gases. These gases, typically including carbon dioxide, nitrogen, or water vapor, get trapped within the material matrix, causing it to expand and form a cellular or foamy texture. Common examples of inorganic chemical foaming agents include carbonates (like calcium carbonate and sodium bicarbonate), which release carbon dioxide upon heating, and some metal hydrides that can generate hydrogen gas. These agents are widely used in various industries, such as plastics manufacturing, rubber processing, and construction materials production, to impart lightweight, insulating, or cushioning properties to the final products.
