Abstracts

According to our (Global Info Research) latest study, the global Insect Pheromones market size was valued at US\$ 492 million in 2024 and is forecast to a readjusted size of USD 807 million by 2031 with a CAGR of 7.4% during review period.

At present, the basic means of pest control in agricultural production still mainly rely on chemical pesticides, but the long-term and uncontrolled use of chemical pesticides has brought many side effects. First, the emergence of pest resistance has led to the continuous increase in the amount and concentration of pesticides used, the cost has increased year by year, and prevention and control has become increasingly difficult; second, it destroys the ecological balance. While preventing and controlling pests, a large number of natural enemies are killed, causing the rampant harm of secondary pests; third, it pollutes the environment. A large amount of pesticide residues remain in crops, soil, rivers, lakes and seas, and are enriched in the human body through the food chain, causing further harm to humans. Relevant research departments at home and abroad are working hard to explore and study new ways and technologies for pest control. These studies include: the development of new, efficient, environmentally friendly, low-toxic, and low-residue chemical insecticides; the use of natural enemy insects and microbial pesticides; the application of insect sterilization technology and insect hormones; among them, the use of insect hormones, especially the use of insect pheromones for pest control is increasingly attracting people's attention and attention. Insect pheromones, also known as insect sex pheromones or insect external hormones, are chemical factors secreted or excreted by insects, which are used to trigger social responses among members of the same species. These chemical pheromones transmit various information such as aggregation, foraging, mating, and vigilance among insects, and are the chemical molecular language of insect communication. With the continuous

growth of global agricultural production and the increasing attention to environmental protection and ecological balance, the market size of insect pheromones, as a green and efficient pest control method, has shown a steady growth trend. Insect pheromones have important applications in agricultural production, mainly used to prevent and control crop diseases and insect pests. By utilizing the disorientation technology of insect pheromones, the mating behavior of pests can be interfered with, thereby reducing the population density of pests, reducing the use of pesticides, and ensuring the safety and quality of agricultural products. In addition, insect pheromones can also be used in many fields such as plant quarantine and regional surveys of insects.

The global insect pheromone market presents a diversified competitive situation. Major manufacturers include Shin-Etsu, BASF, Sutterra, Biobest Group, Provivi and other well-known companies, which have occupied a certain share in the market with their respective technological advantages, product characteristics and market layout. However, with the continuous development of the market and the entry of new companies, market competition will become more intense. At present, Europe is the world's largest consumer market, accounting for 34.65% of the market share in 2023, followed by North America and China, accounting for 24.00% and 17.11% respectively. It is expected that China will grow the fastest in the next few years, with a CAGR of approximately 10.11% during 2024-2030.
