Abstracts

According to our (Global Info Research) latest study, the global Integrated Type Current Sensor market size was valued at US\$ 341 million in 2024 and is forecast to a readjusted size of USD 419 million by 2031 with a CAGR of 3.0% during review period.

The integrated eddy current sensor integrates both the probe and the electronic processing components. There is no need for high frequency coaxial cable connection and no need for optional preamplifier. Eddy current sensor is a sensing device based on eddy current mutual inductance effect, which can realize high-precision detection of internal defects and trace displacement of the measured object. Due to its significant advantages such as non-contact measurement, wide frequency response, and strong anti-interference ability, it is widely used in important fields such as equipment non-destructive testing and online condition monitoring.

An integrated eddy current sensor is an eddy current sensor that integrates a sensor and a signal processing circuit. Unlike the separate eddy-current sensors mentioned earlier, integrated sensors combine the sensor and electronics in a single package, making it easier to provide non-contact measurement and signal processing. Integrated eddy-current sensors are widely used in industry for applications such as non-contact measurement, defect detection, material classification, and structural health monitoring. They play an important role in automated production, quality control and fault diagnosis.
