Abstracts

According to our (Global Info Research) latest study, the global Intelligent Rotational Viscometer market size was valued at US\$ 423 million in 2024 and is forecast to a readjusted size of USD 491 million by 2031 with a CAGR of 2.1% during review period.

The working principle of the intelligent rotational viscometer is based on the Newtonian fluid model, which states that shear stress is proportional to shear rate. When the rotor of a rotational viscometer rotates in a liquid, the liquid will generate resistance to the rotor, and the magnitude of this resistance is directly related to the viscosity of the liquid. By measuring the resistance (usually manifested as torque) experienced by the rotor, the viscosity of the liquid can be calculated using specific formulas or algorithms.
