An interspinous stabilization device is a type of medical device that is used to treat back pain and improve spinal stability. It is a small, implantable device that is inserted between the spinous processes of the vertebrae in the lower back. The spinous processes are the bony protuberances that protrude from the back of the spine. Interspinous stabilization devices are typically used to treat degenerative conditions of the spine, such as degenerative disc disease, spinal stenosis, and spondylolisthesis. They may also be used to treat spinal fractures and other conditions that cause back pain and instability.
