According to our (Global Info Research) latest study, the global Intraoperative Nerve Monitoring System market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

An Intraoperative Nerve Monitoring (IONM) System is a medical technology used during surgeries to monitor the functional integrity of nerves in real time. It helps surgeons identify and protect critical neural structures, such as motor and sensory nerves, by providing continuous feedback about nerve activity. This is especially important in complex procedures, such as neurosurgery, spinal surgery, and head and neck surgeries, where accidental nerve damage can lead to complications like paralysis, loss of sensation, or impaired bodily functions. The system uses electrical stimulation and recording techniques to track nerve signals, reducing the risk of injury and improving patient outcomes by enabling timely corrective actions during surgery.
